Chris Martin

Bimodality in colors

$z \sim 0.1$

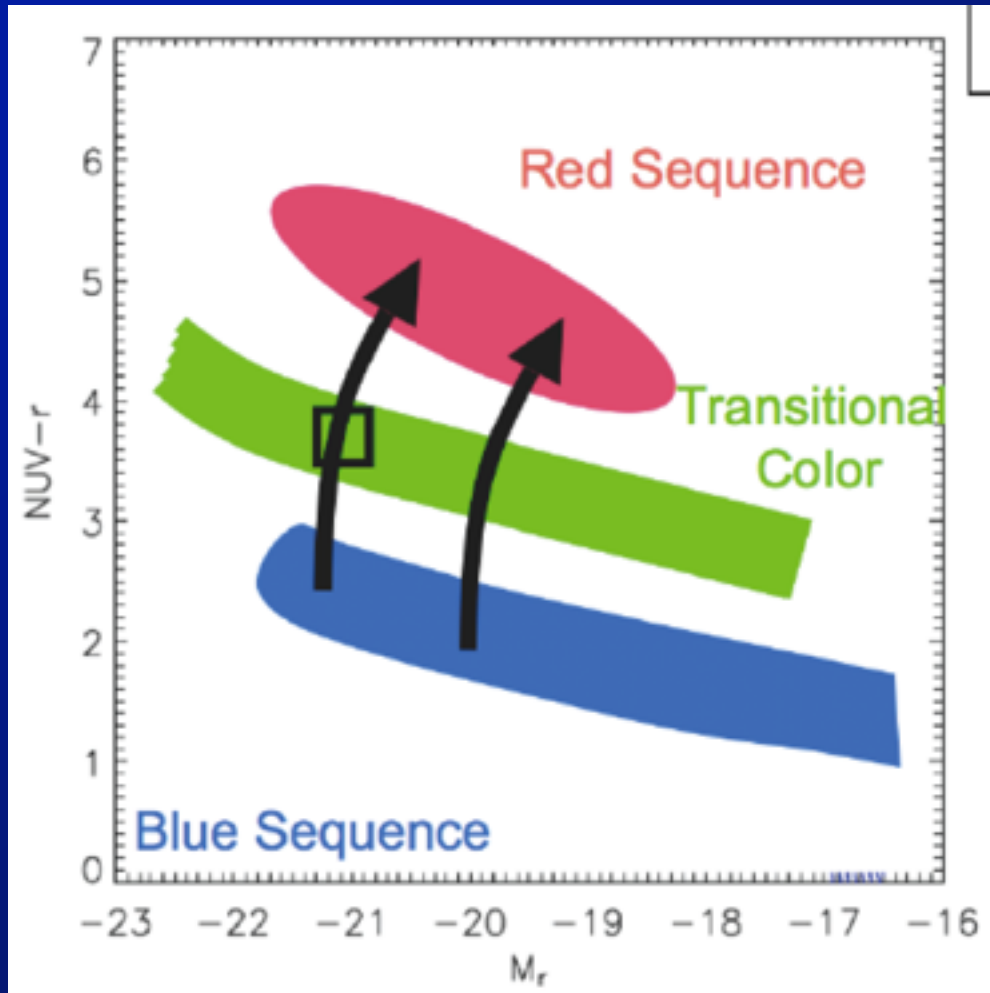

Wyder+07

$z \sim 1.0$

Willmer+06

The mass flux density

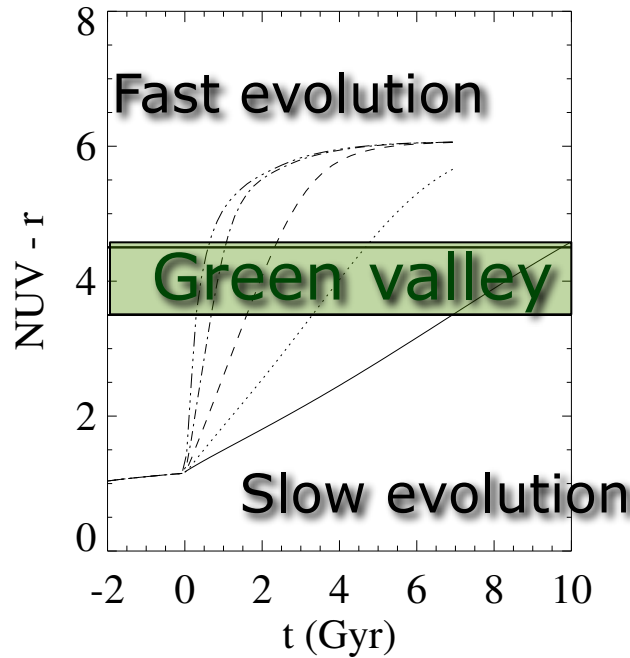

- Stellar mass
- Number density
- Transition timescales

$$\Phi(M_r, NUV-r) = \dot{\Phi}_B(M_r) \langle \tau(M_r, NUV-r; \xi) \rangle$$

Spectroscopic indices to determine star formation history of galaxies

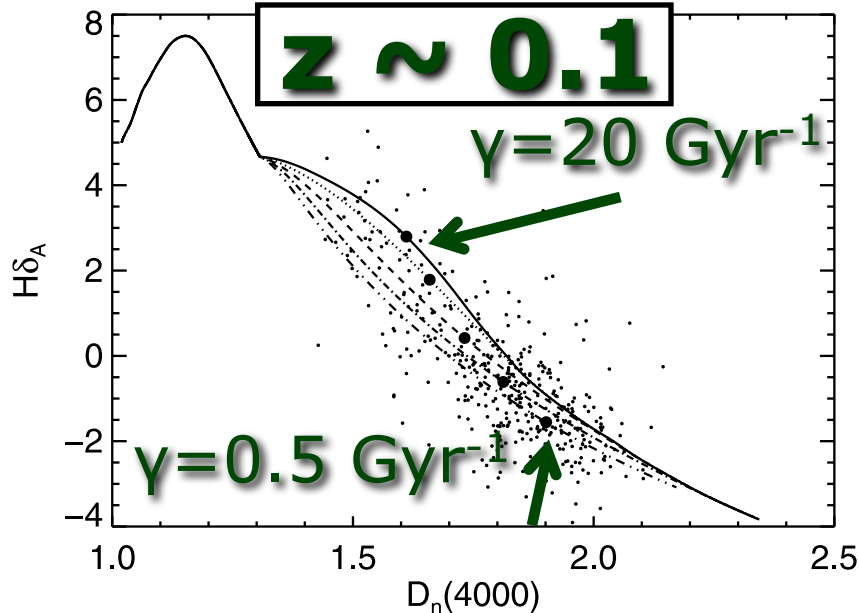

Kauffmann+03

$$SFR(t) = \begin{cases} SFR(t_0) & t < t_0 \\ SFR(t_0)e^{-\gamma t} & t > t_0 \end{cases}$$

The mass flux density in the green valley and the evolution of the red sequence agree

Martin+07

The universe was forming stars more at a faster rate in the past

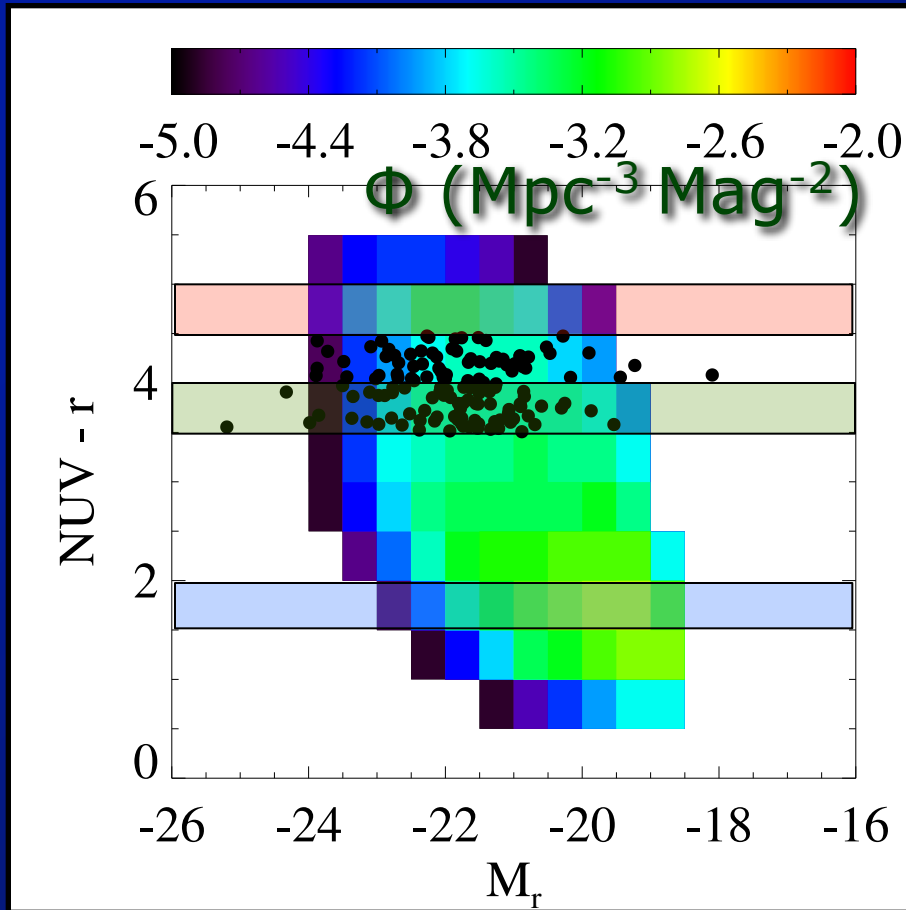

Hopkins+06

Downsizing!!

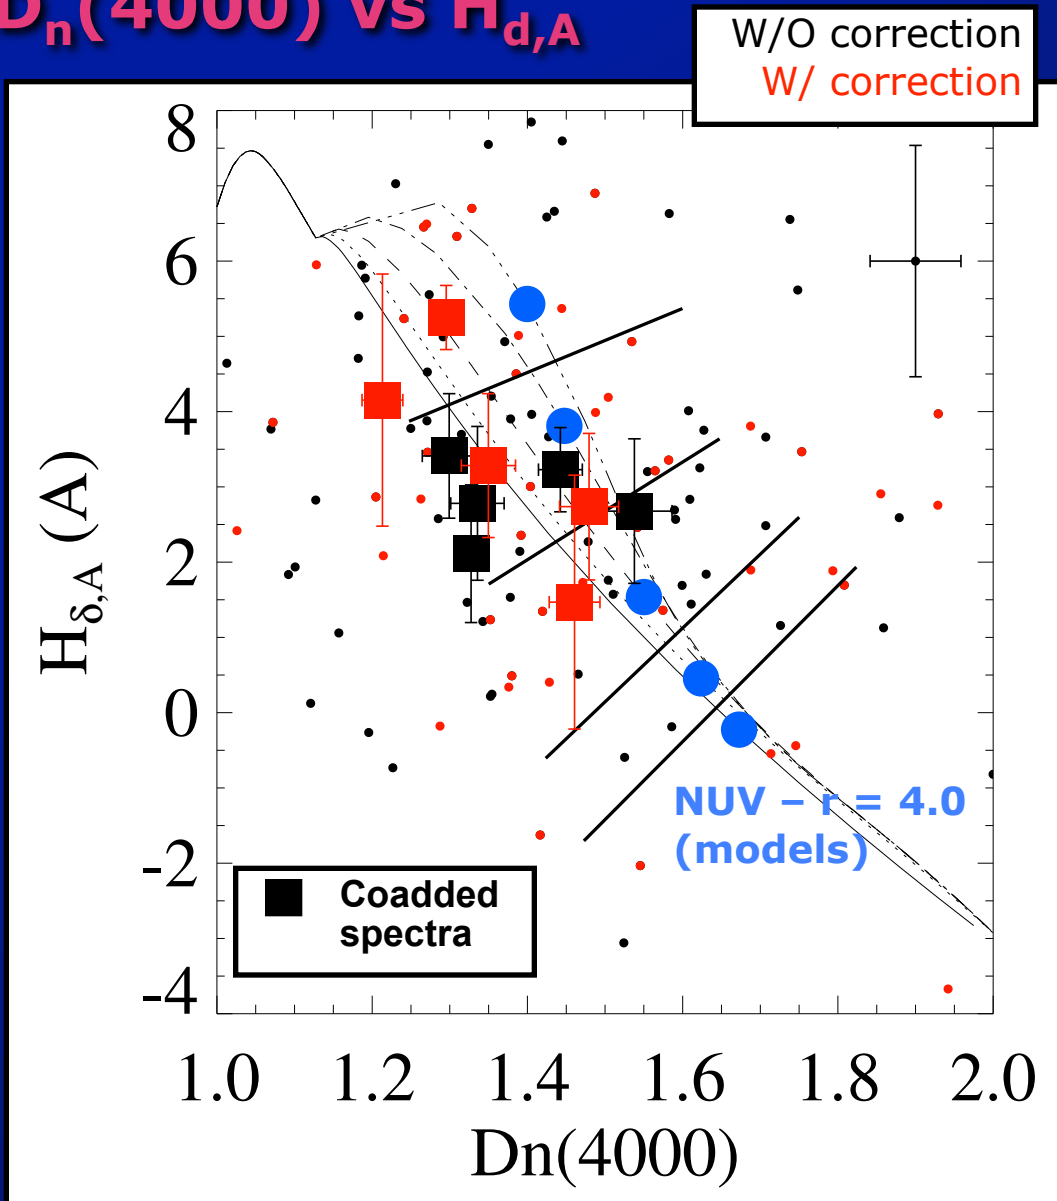

The CM diagram and the Luminosity function at $z \sim 0.8$

Luminosity functions are systematically shifted towards brighter magnitudes at higher redshift

Gonçalves+12

$D_n(4000)$ vs $H_{\delta,A}$

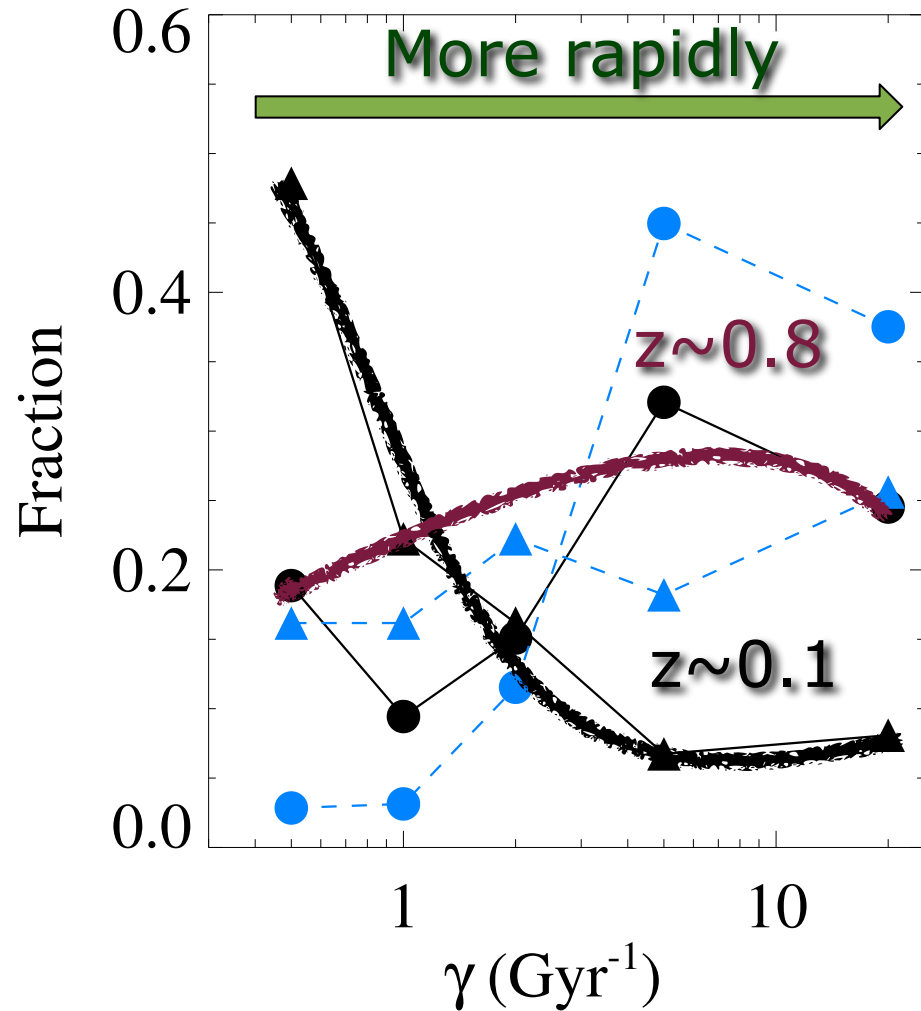

Gonçalves+12

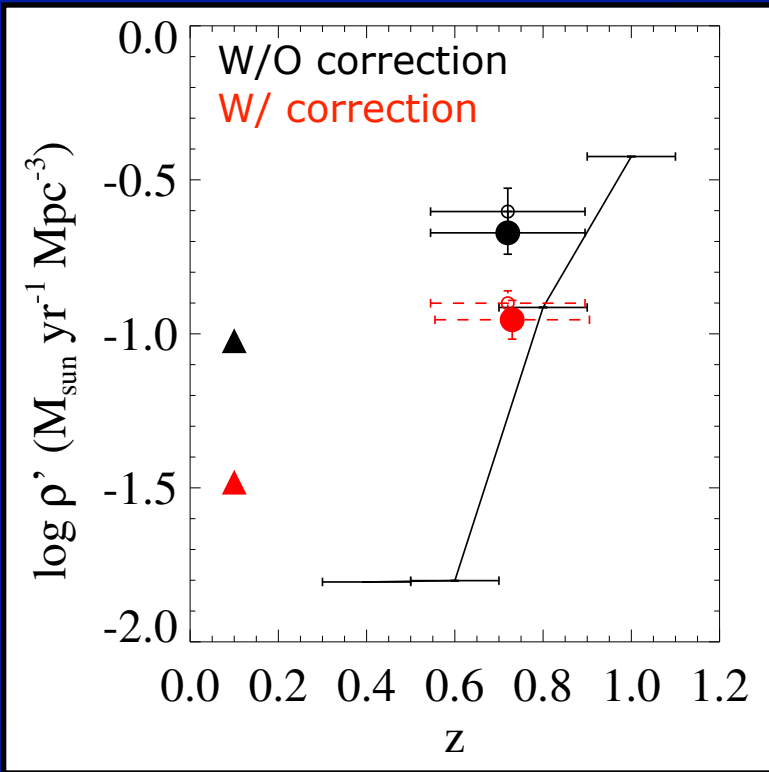

Deepest spectra ever taken of green valley galaxies (8-9hr Keck)

Galaxies move
across the green
valley more rapidly
at $z \sim 0.8$

Gonçalves+12

The mass flux density evolution agrees with the growth of the red sequence (Faber et al. 2007)

Mass flux density happens in fainter, less massive galaxies in recent times

Brighter, more massive

“Top-down” scenario for the evolution of the red sequence:

- Massive red galaxies form earlier from quenching of star formation in massive spirals
- This process moves to low-mass galaxies in the local universe
- Downsizing!

Borch+06

Evolution of the CM diagram

Physical processes?

Bars and secular evolution

EGS, HST/ACS, $z \sim 0.8$

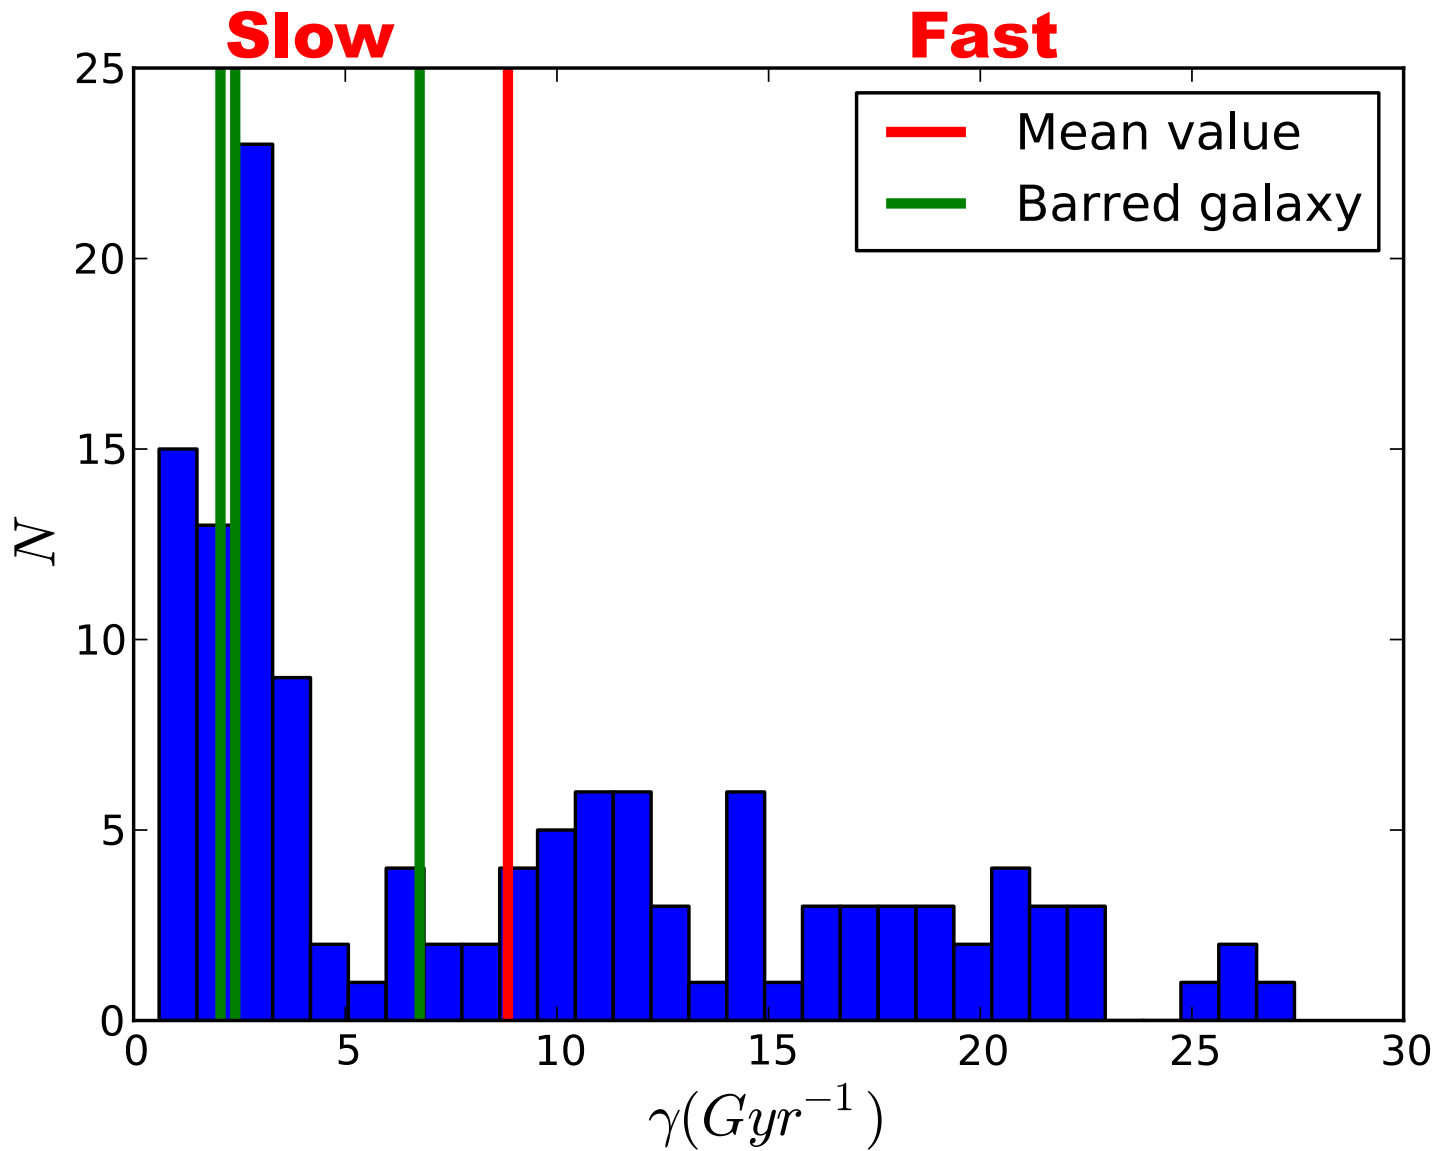

Lotz+08

Nogueira-Cavalcante+, in prep

Ellipticity determination
(Menéndez-Delmestre+07)

Summary

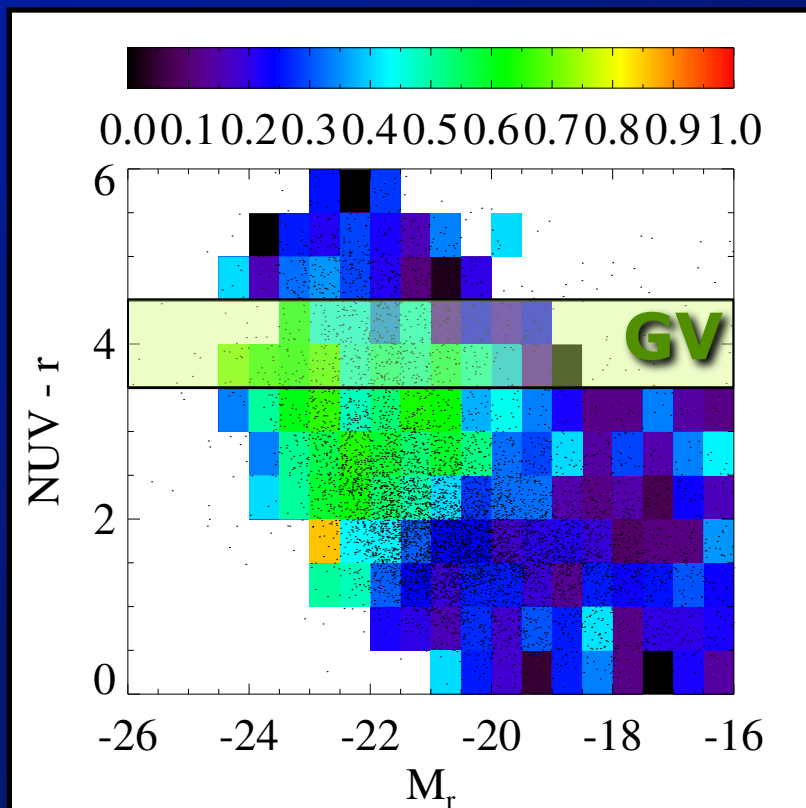

- Through deep spectroscopy, we can estimate the star formation history of galaxies at $z \sim 0.8$
- The evolution of the mass flux density: at earlier times, faster transition happening in more massive galaxies
- “Top-down” scenario: more massive galaxies in the red sequence were formed earlier, and less massive objects fill in at later times
- Bars appear to indicate slow quenching. More secular evolution at low- z ?

Correcting for extinction

Contamination:

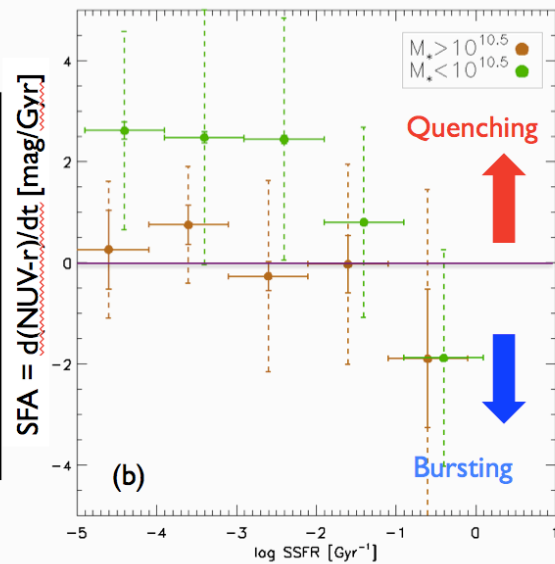

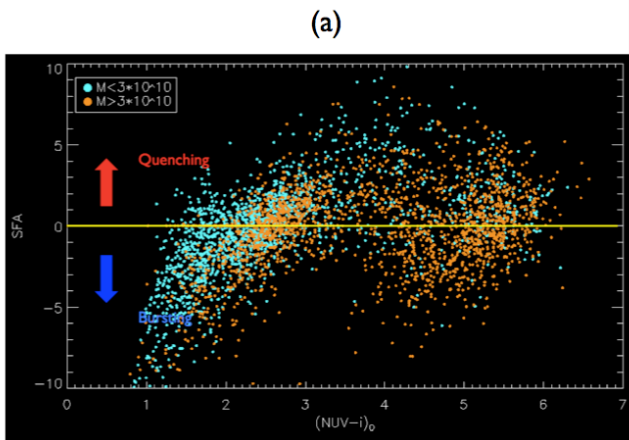

Up to 70% of the green valley galaxies are dusty starbursts detected in MIPS 24 μ m

Extinction-corrected CM diagram

Star formation acceleration (SFA)

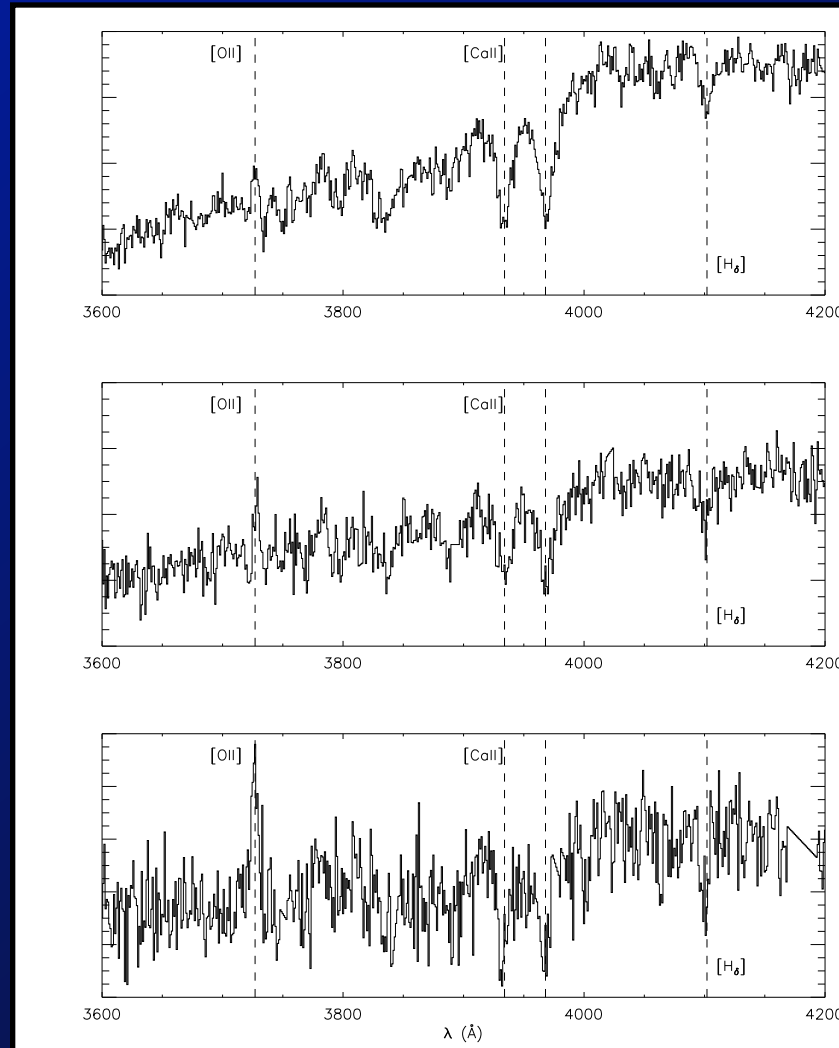

GALAXY PHYSICAL PARAMETERS (GPP) ACROSS THE UVOCMD.

Gonçalves et al.
2013

Example spectra

Spectral features are distinguishable down to $r \sim 24$

$r \sim 21.5$

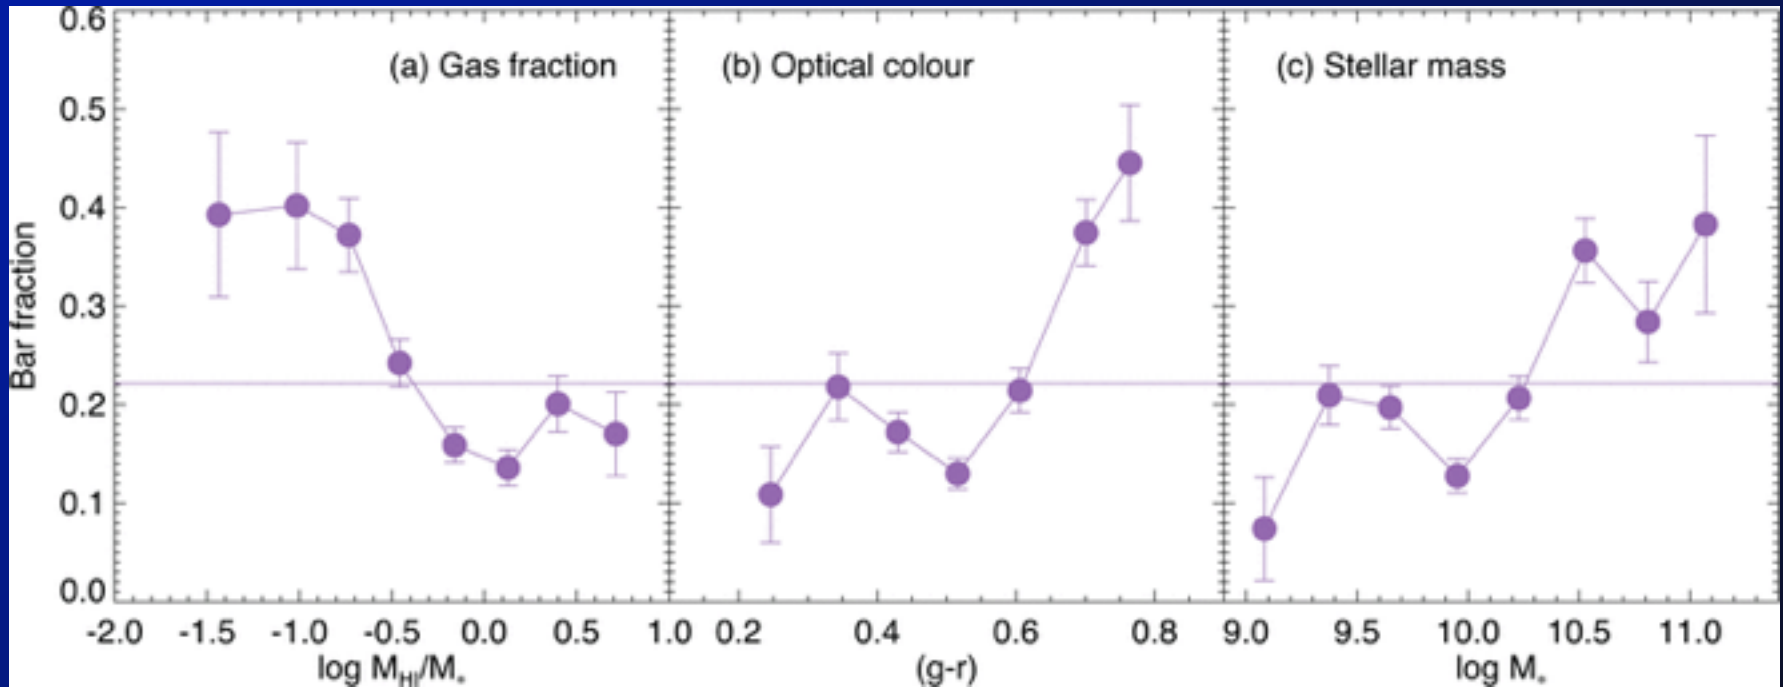

$r \sim 22.5$

$r \sim 23.5$

Gonçalves+12

Bars come AFTER quenching?

Increased bar fraction in the red sequence

Masters+12

No evolution in central density or velocity dispersion after quenching

We will be able to correlate quenching timescales with bar properties - at low AND high redshift

Fang+13
