The Galaxy And Mass Assembly survey

www.gama-survey.org

What is GAMA?

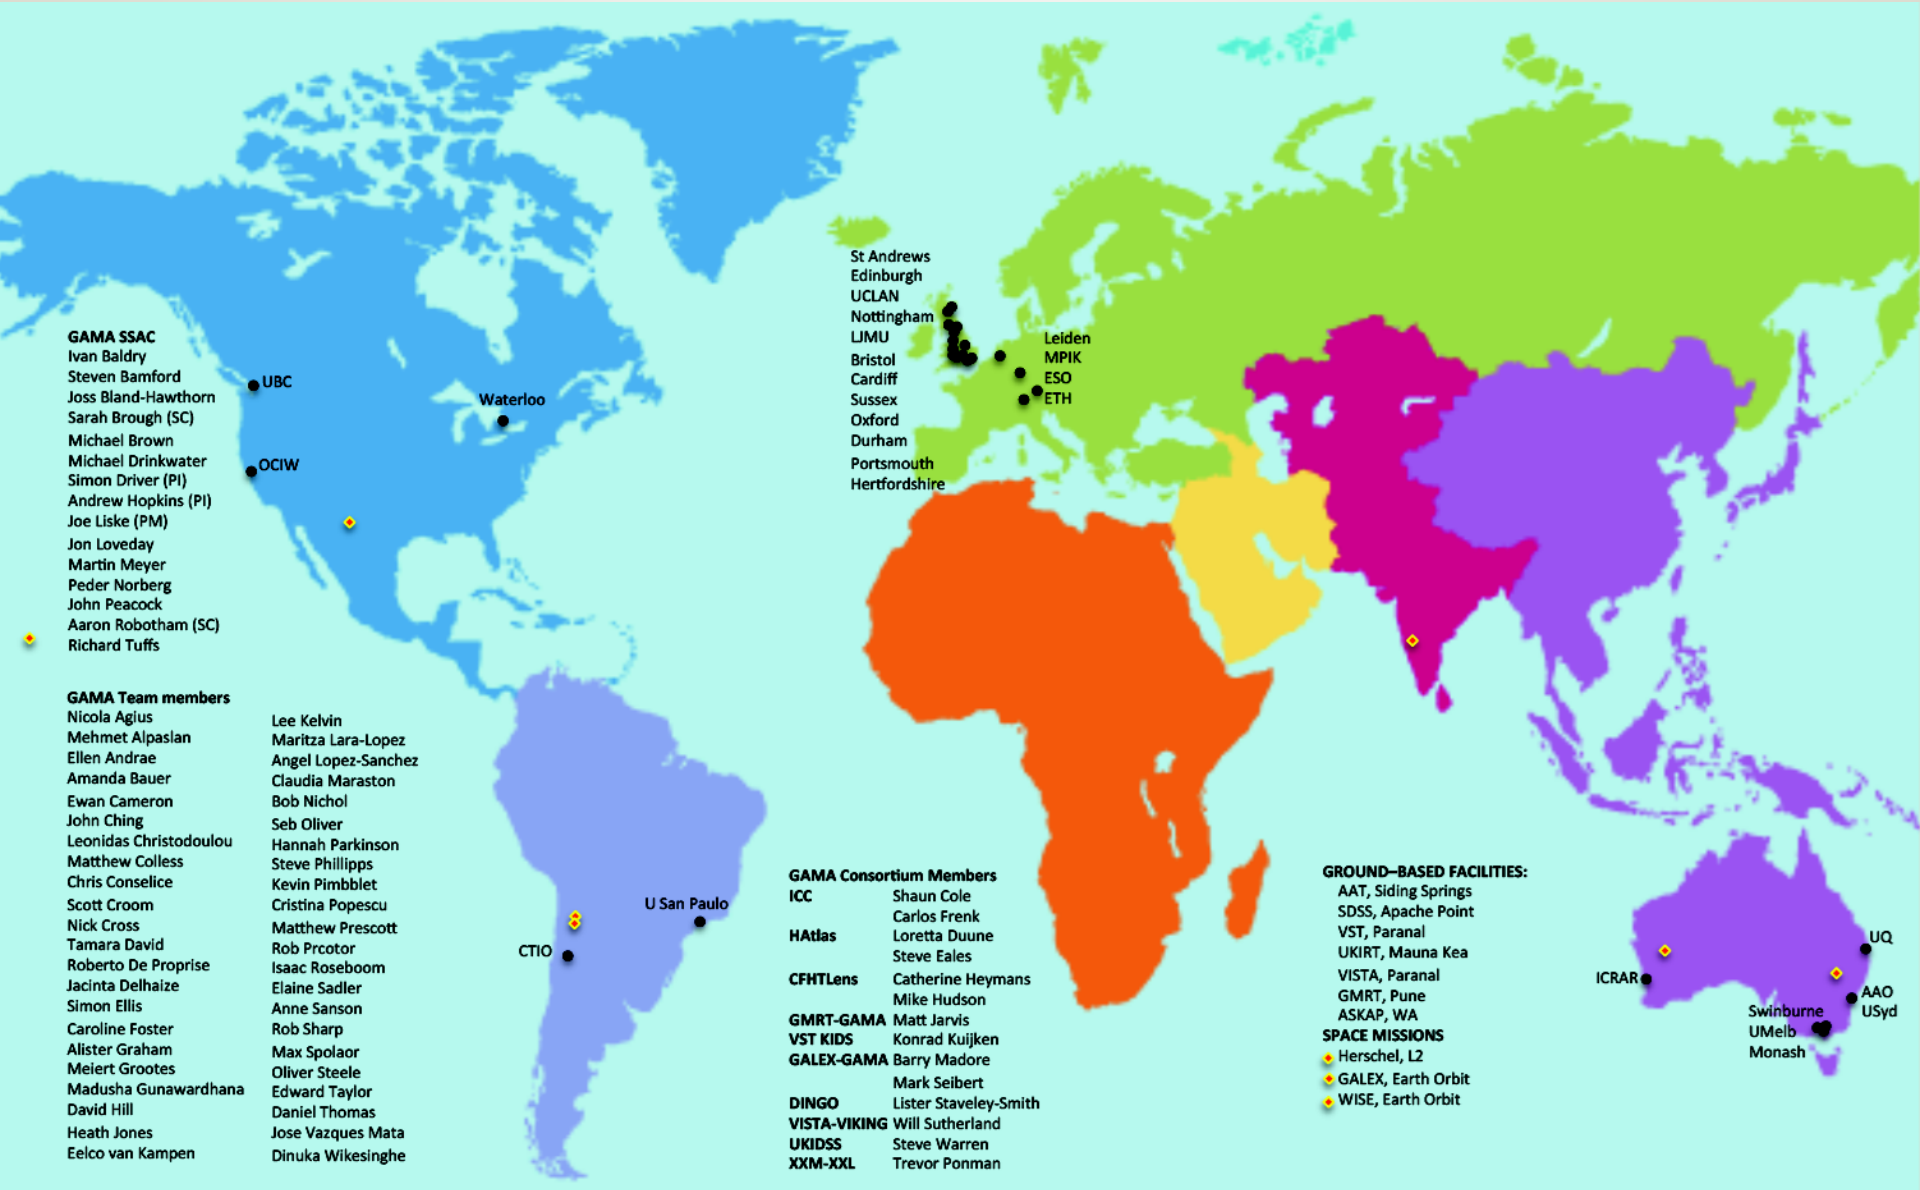
- A comprehensive survey of low-redshift ($z < 0.5$) galaxies to study galaxy evolution and cosmology
- GAMA = spectroscopic survey + alliance of imaging surveys

Key features

- $r < 19.8$ mag
- Area = 286 deg^2
- N_{gal} = 270,000
- Spectroscopy: 2 mag deeper than SDSS, multi-pass
- Imaging: near-complete wavelength coverage, ~2x better resolution

The team

101 team members, 53 collaborators

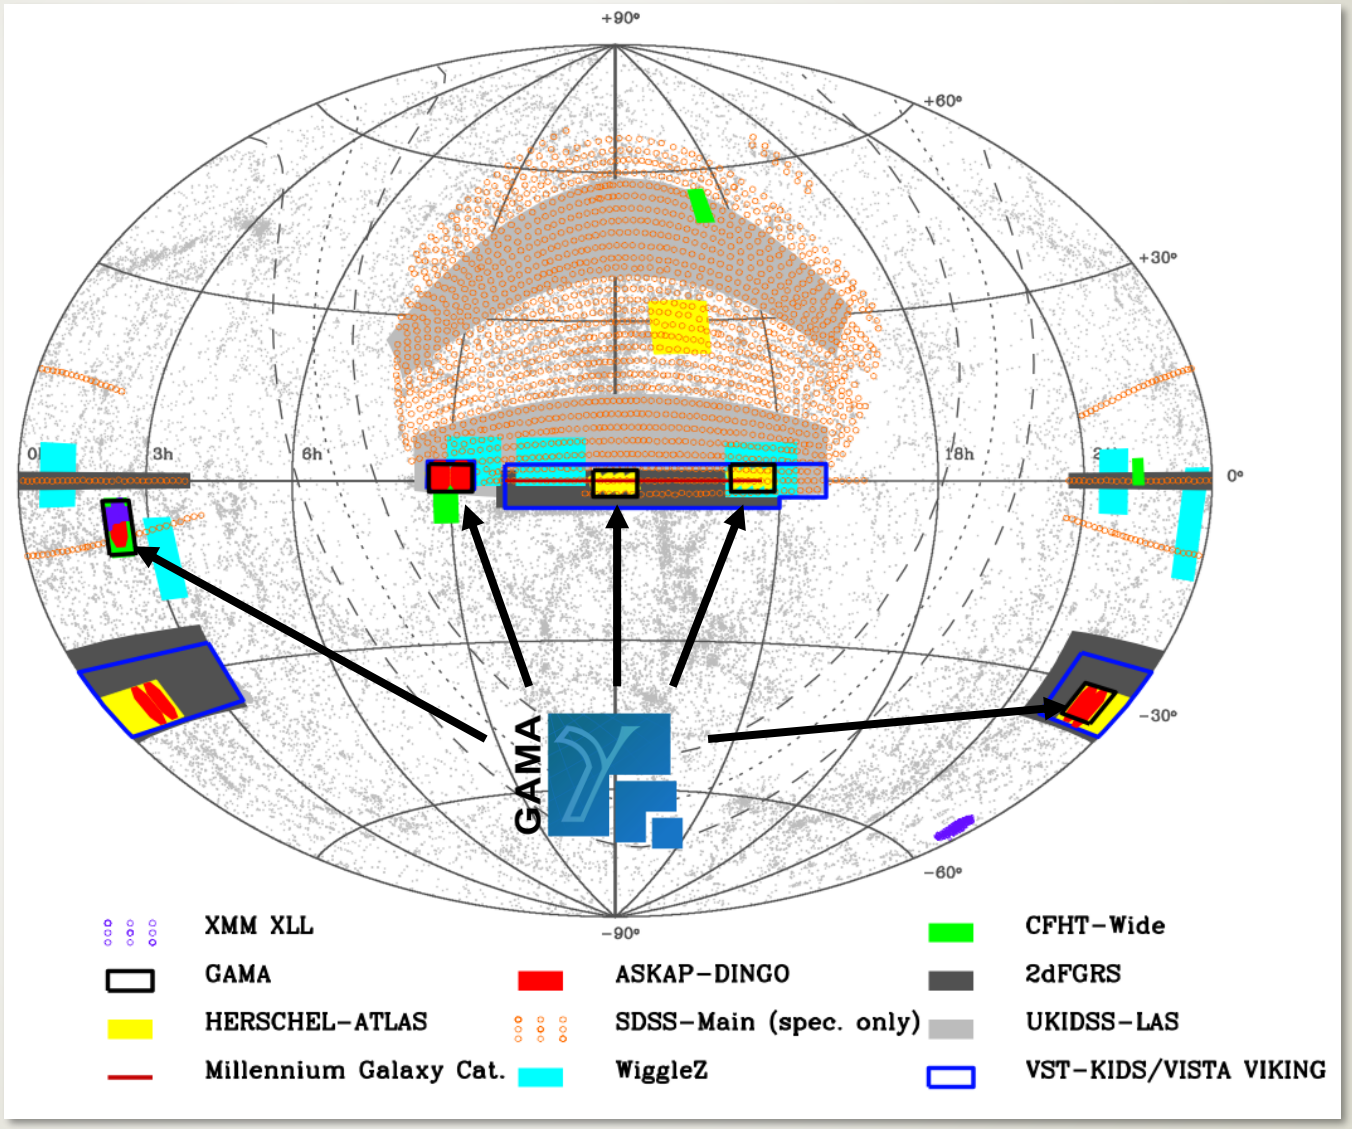


GAMA survey regions

5 survey regions:

- 3 equatorial
- 2 southern

Total area = 286 deg^2



Photometry: 1 nm – 1 m

GAMA spectroscopy

- 210 nights (4 FTEs!) of multi-object fibre spectroscopy using AAT/2dF+AAOmega
- Area: 286 deg^2 split over 5 survey regions
- Main sample: ~270k galaxies to r < 19.8 mag
- R = 1300, 370 < λ < 880 nm
- <z> = 0.27

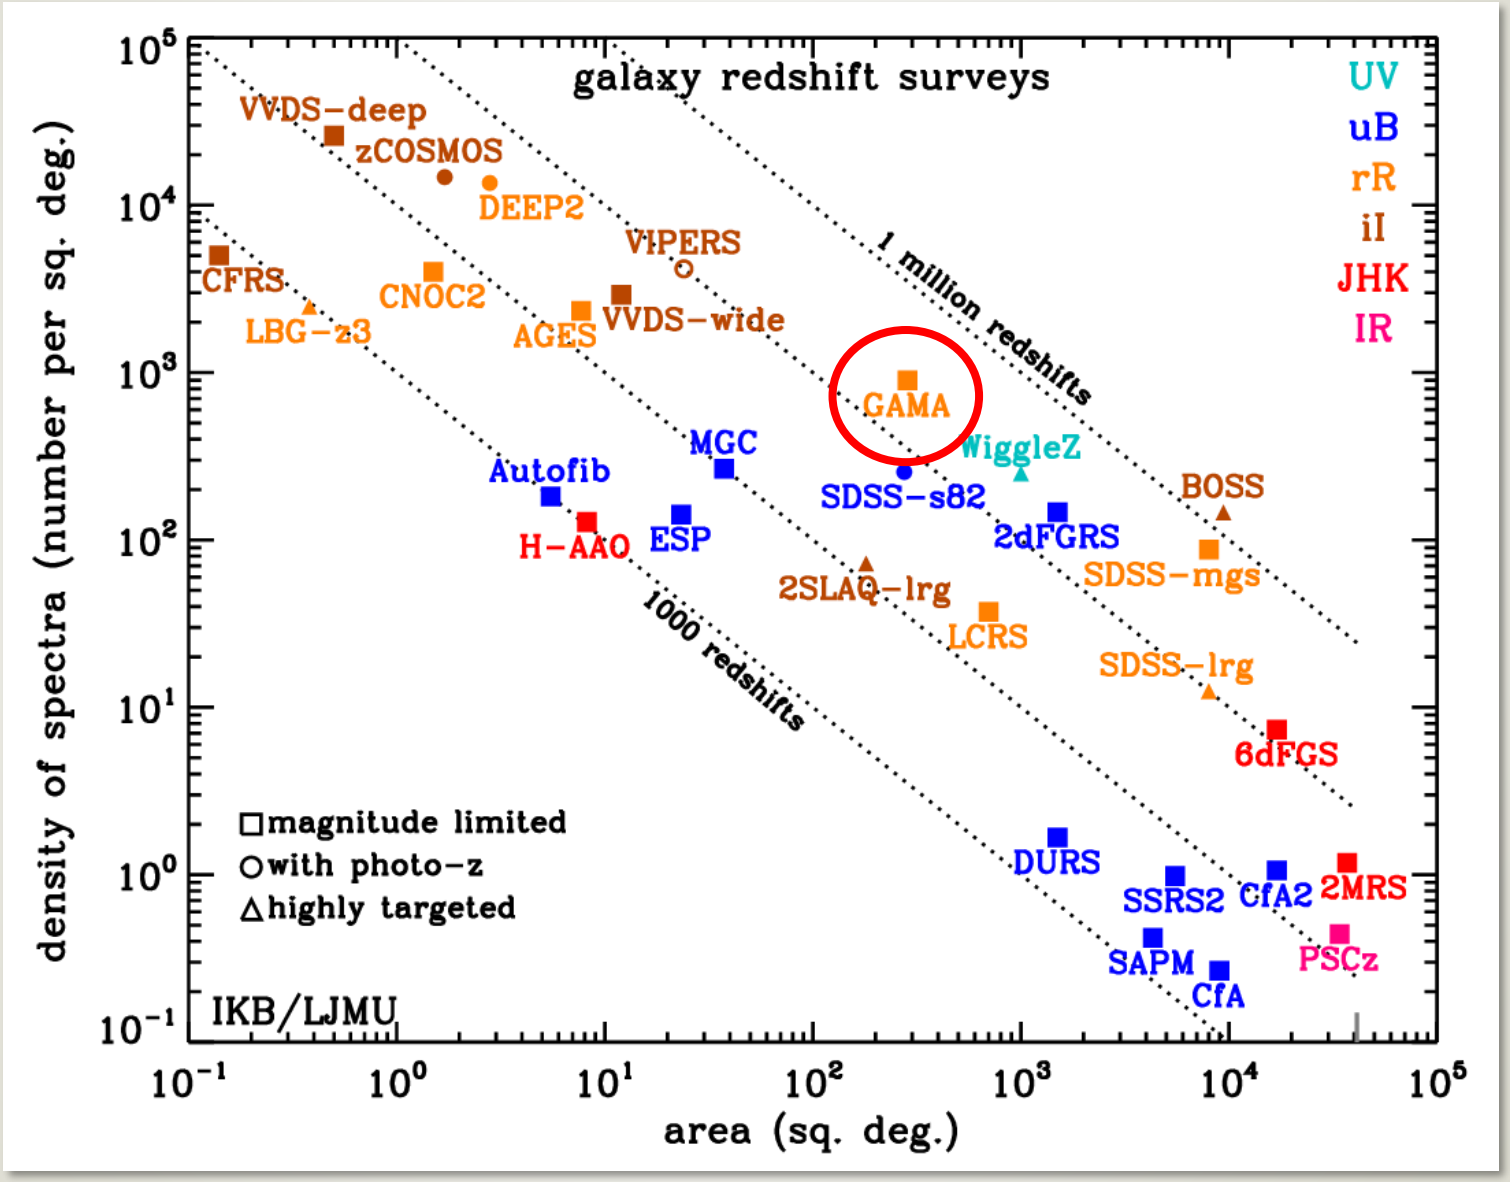
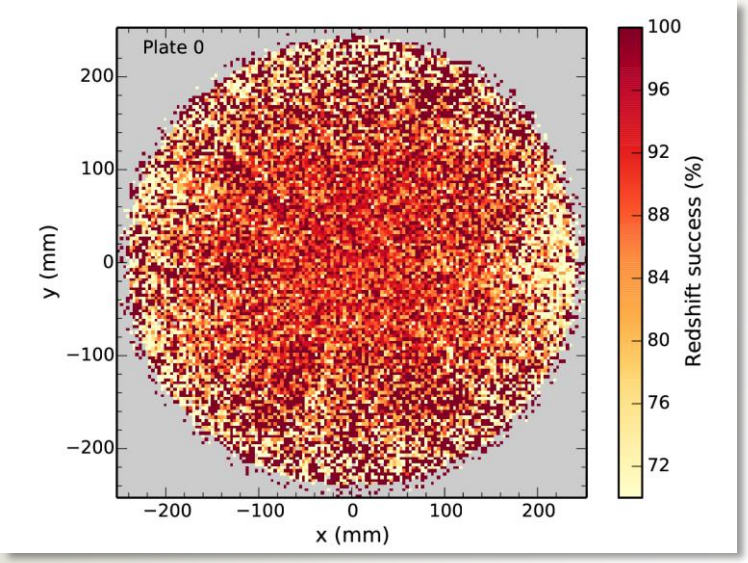
Photometric Redshifts

How does GAMA fit in?

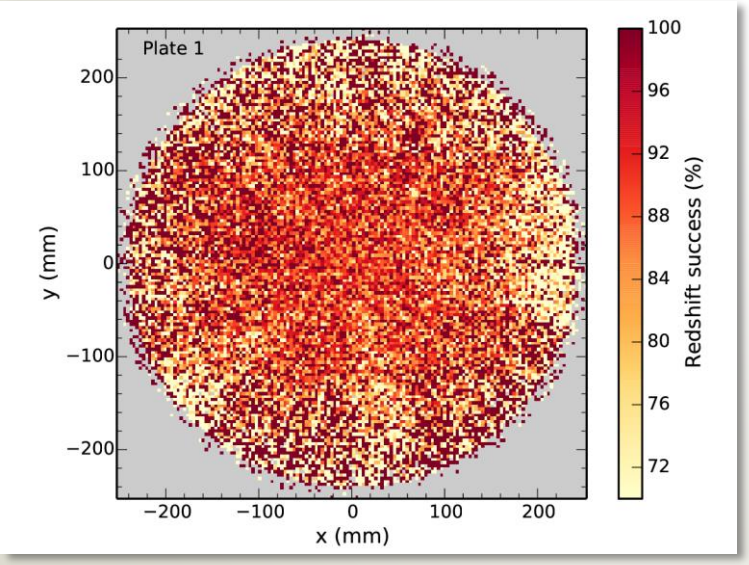


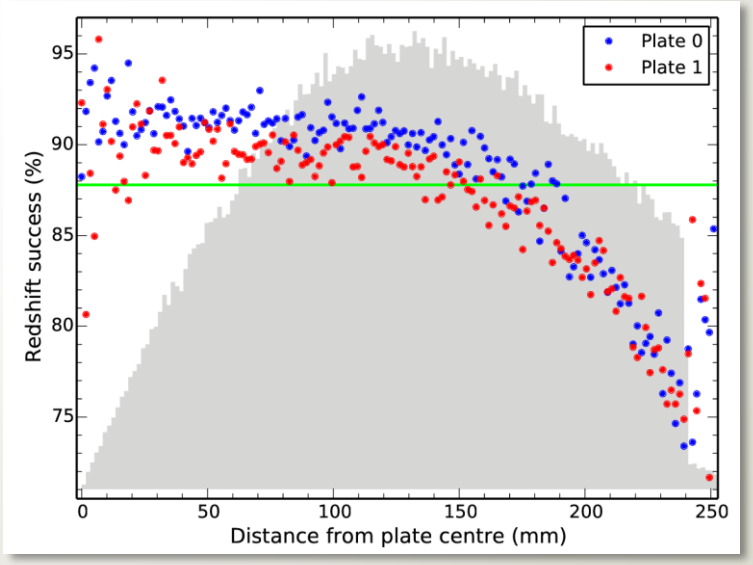
by Ivan Baldry

Selection function management



- Dependence of redshift success on fibre position on the plate.
- Several possible causes, including:
  - Systematic errors in astrometry, field rotation, correction for atmospheric refraction, …
  - Radial variation of apparent fibre diameter, focal ratio degradation, non-telecentricity, …

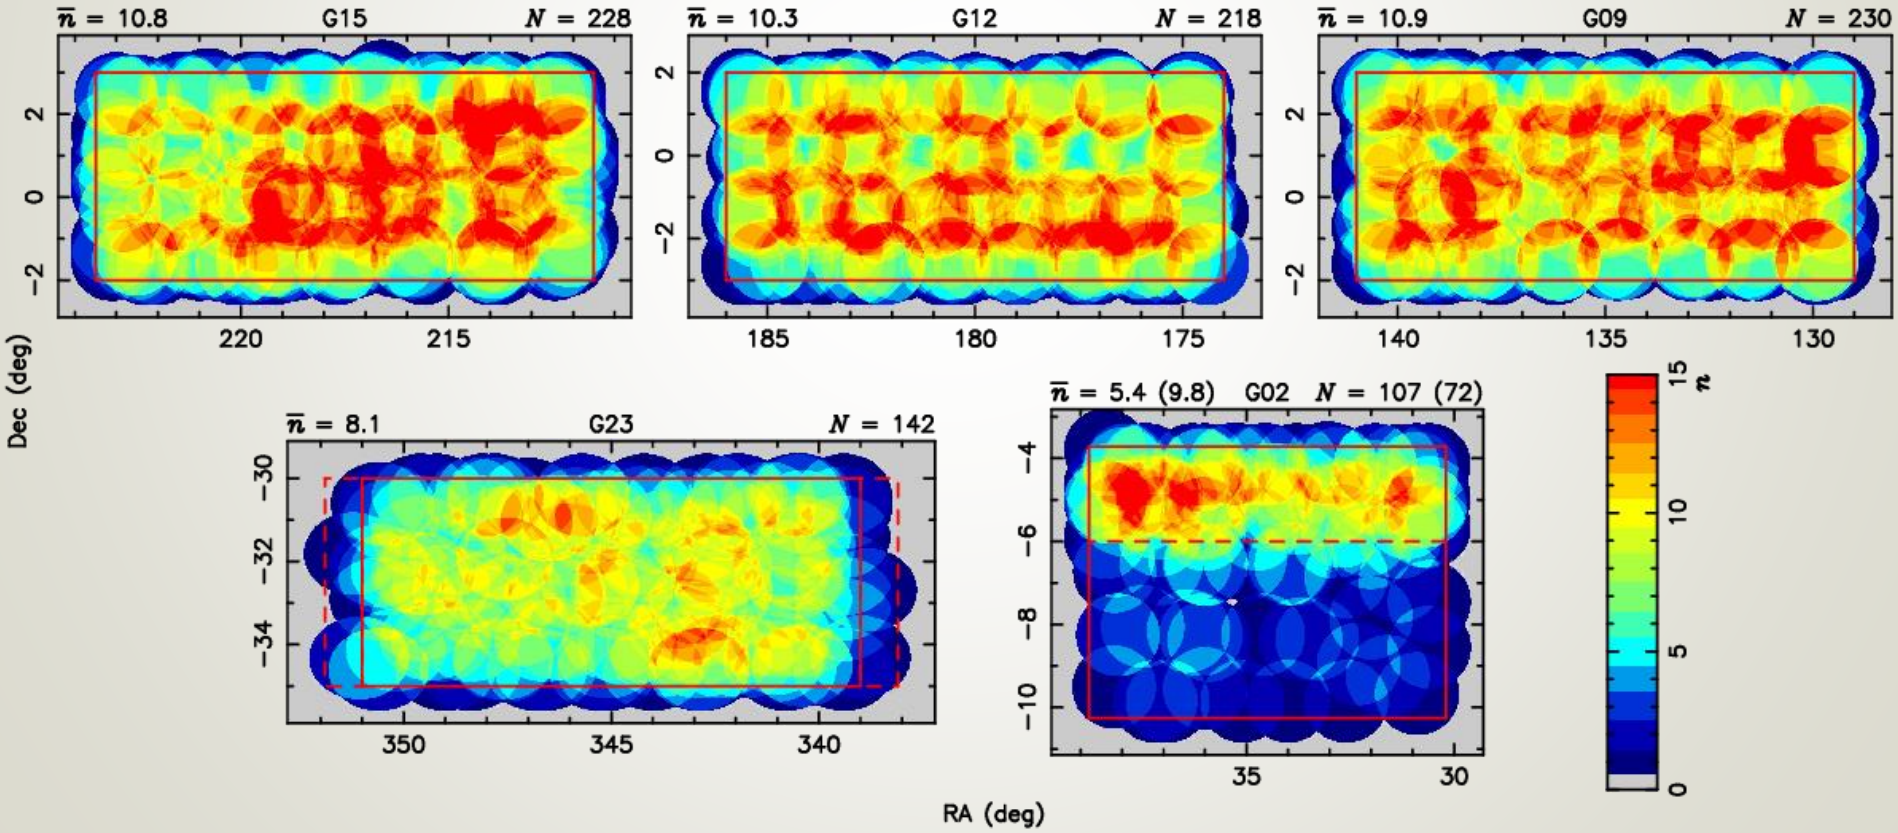




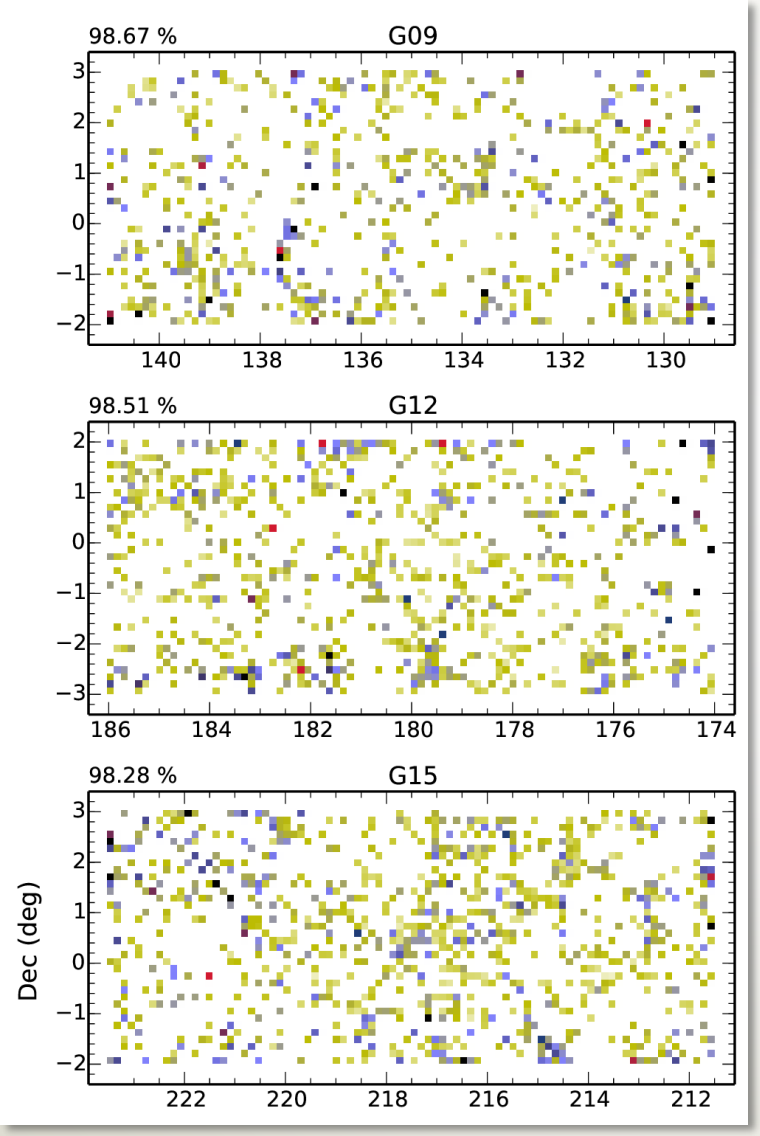
Liske et al. (2015)

Selection function management

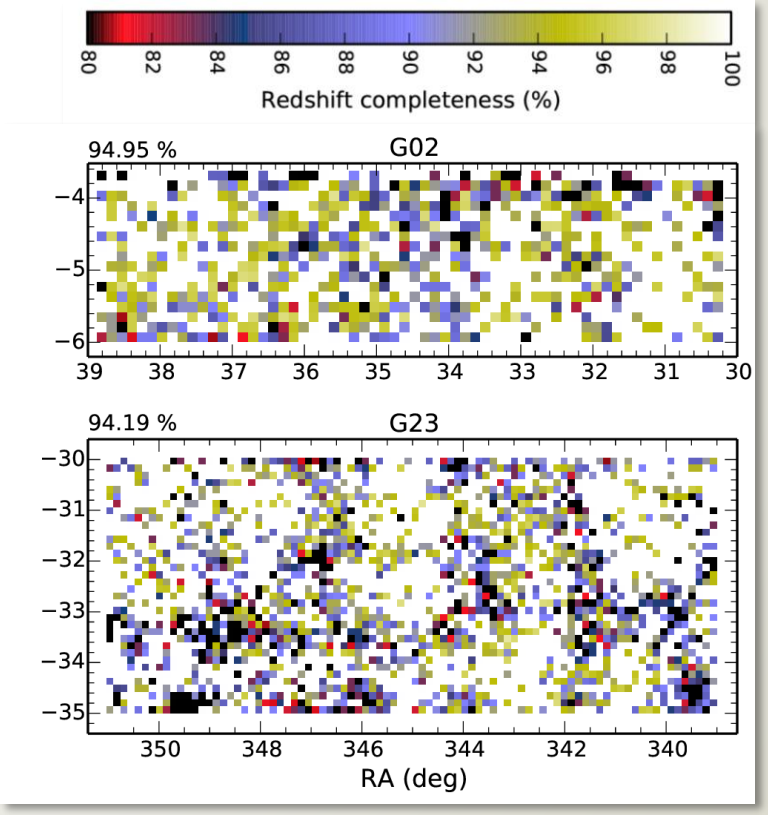
- GAMA is a multi-pass survey by design.
- Tiling strategy is important! It affects the homogeneity of the incompleteness as well as survey efficiency.
- In GAMA: next tile placed where it most decreases local incompleteness.



Selection function management



- Smooth large-scale distribution of incompleteness.



Liske et al. (2015)

Selection function management

Maintaining high redshift completeness in dense regions is crucial for the identification of groups and mergers.

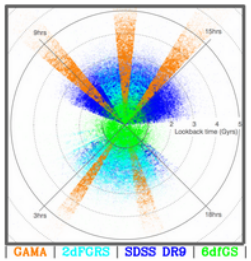
GAMA Data Release 2

The second GAMA data release (DR2) provides AAT/AAOmega spectra, redshifts and a wealth of ancillary information for 72,225 objects from the first phase of the GAMA survey (2008 - 2010, usually referred to as GAMA I). The DR2 web pages describe the data included in this release, and provide access to an SQL database as well as to the actual data (spectra and catalogues).

If you are using GAMA DR2 data in a publication then please cite the DR2 paper (Liske et al. 2015) and acknowledge GAMA.



What is released?

The GAMA I survey extends over three equatorial survey regions of 48 deg^2 each (called G09, G12 and G15) and down to magnitude limits of r < 19.4 mag in G09 and G15, and r < 19.8 mag in G12. In DR2 we are releasing data for all GAMA I main survey objects with r < 19.0 mag (G09 and G12) or r < 19.4 mag (G15). Note that for G15 we are essentially releasing all GAMA I data. The total number of objects included in DR2 is 72,225. Of these, 70,726 objects (98%) have secure redshifts.

Details of the object selection for DR2:

- The qualifier 'GAMA I' refers to the fact that the objects for DR2 were selected from the input catalogue for the first phase of the GAMA survey (= GAMA I), see Baldry et al. (2010) for a detailed description of the GAMA I input catalogue.
- The qualifier 'main survey' refers to the fact that some targets were selected in different ways and for different reasons than those of the main GAMA survey. These so-called 'filler' targets were only observed when a fibre could not be allocated to a main survey target. Filler targets are not included in DR2.
- The r-band magnitude is the Petrosian r-band magnitude from SDSS DR6, corrected for Galactic extinction. This is the GAMA I selection magnitude.
- The three GAMA I survey regions are each 12×4 deg^2 in size, for a total survey area of 144 deg^2:

Region	RA range	DEC range	r-band mag limits		
			DR2	GAMA I	GAMA II
G09	129.0 - 141.0	−1 - +3	19.0	19.4	19.8
G12	174.0 - 186.0	−2 - +2	19.0	19.8	19.8
G15	211.5 - 223.5	−2 - +2	19.4	19.4	19.8

▶ DR2 > Schema browser

GAMA Schema Browser

The schema browser allows you to explore the contents of the DR2 SQL database. It shows you which tables/catalogues are available for queries and what they contain. The GAMA data flow is organised around so-called Data Management Units (DMUs), and it is these DMUs that produce the tables in this database. The schema browser provides access to all of the meta-information provided by each DMU, both on the DMU itself as well as on individual tables/catalogues. If you find any of this information unclear, incomplete or incorrect then you may either directly get in touch with the contact person of that DMU or table, or else contact the database team.

The table below provides an overview of the contents of the database. It lists all DMUs for which products are being released in DR2. Begin exploring the database by clicking on the DMU names.

DMU name	Version	Description
InputCat	v16	This DMU provides various input catalogues for the spectroscopy.
ExternalSpec	v01	This DMU collects spectra for GAMA DR2 objects from previous spectroscopic surveys such as the SDSS.
SpecCat	v08	This DMU provides the final spectra and redshift catalogues, including GAMA AAT and external data.
LocalFlowCorrection	v07	This DMU performs local flow correction, and provides redshifts in different frames of reference.
ApMatchedPhotom	v02	This DMU provides aperture matched ugrizYJHK photometry.
SersicPhotometry	v07	This DMU provides a single-component Sersic fit in each of the ugrizYJHK bands for every GAMA DR2 galaxy.
GalexPhotometry	v02	This DMU provides GALEX NUV and FUV photometry for GAMA DR2 objects.
kCorrections	v02	This DMU provides k-corrections in the GALEX FUV and NUV bands, the SDSS ugriz bands and the UKIDSS YJHK bands for all GAMA DR2 galaxies.
SpecLineSFR	v04	This DMU provides emission and absorption line measurements for all GAMA DR2 AAT spectra, as well as derived physical properties, including the star-formation rate, for all GAMA DR2 spectra and for all SDSS spectra of GAMA DR2 objects.
StellarMasses	v08	This DMU provides stellar masses, restframe photometry, and other ancillary stellar population parameters for all z < 0.65 galaxies in the GAMA DR2 sample.
EnvironmentMeasures	v02	This DMU provides several different metrics of the local environment of GAMA DR2 galaxies: a surface density, the number of galaxies within a cylinder, and the density of galaxies within an adaptive Gaussian ellipsoid.
GroupFinding	v05	This DMU provides the GAMA Galaxy Group Catalogue (G3C).
