## Swagelok Hose and Flexible Tubing Nomenclature

### Hose

A multiple-layered flexible conduit through which fluid is conveyed from one point to another.

### Nominal Hose Size

An approximation of the hose inside diameter.

### Flexible Tubing

A single-layered flexible conduit through which fluid is conveyed from one point to another.

### Bend Radius

The radius of the bent section of hose, measured to the center line or inside of the curved section.

### Minimum Dynamic Bend Radius

The smallest bend radius that a hose is rated to perform in a dynamic application.

### Minimum Static Bend Radius

The smallest bend radius that a hose is rated to perform in a static application.

### Flexibility

The relative ease or difficulty of bending a nonpressurized hose or tubing assembly.

### Burst Pressure

The pressure at which leakage occurs when exposed to a laboratory burst test.

### Splices

Splices consist of a connector fitting and crimp collars that join two lengths of hose to form assemblies. Splices may be required to obtain longer hose lengths of fluoropolymer hose (B, X, S, C, N, W, F, and U series), as noted in the **Ordering Information** for each series.

Splice dimensions shown in the table at right are for reference only and are subject to change. Additional overall hose length may be needed to compensate for the effect of splices on hose minimum bend radius. For more information, contact your authorized Swagelok sales and service representative.

### Static Dissipation

The ability of a material to conduct an electrical charge to ground. Select Swagelok hoses are constructed with carbon black-filled nylon, PTFE, or PFA core material for static dissipation. For quick reference in this catalog, these hoses are indicated with the omega symbol ( $\Omega$ ) in the hose description.

### Conductivity

The ability of a material to transmit or conduct an electrical charge. Swagelok hoses constructed with a metallic braid layer have the potential to be conductive hoses. For quick reference in this catalog, these hoses are indicated with the symbol (M) in the hose description.

### Permeation

The movement of a liquid, gas, or vapor through a solid. All materials are permeable to a degree and should be tested for application compatibility prior to installation.

### Dynamic Application

An application in which the hose flexes or changes position.

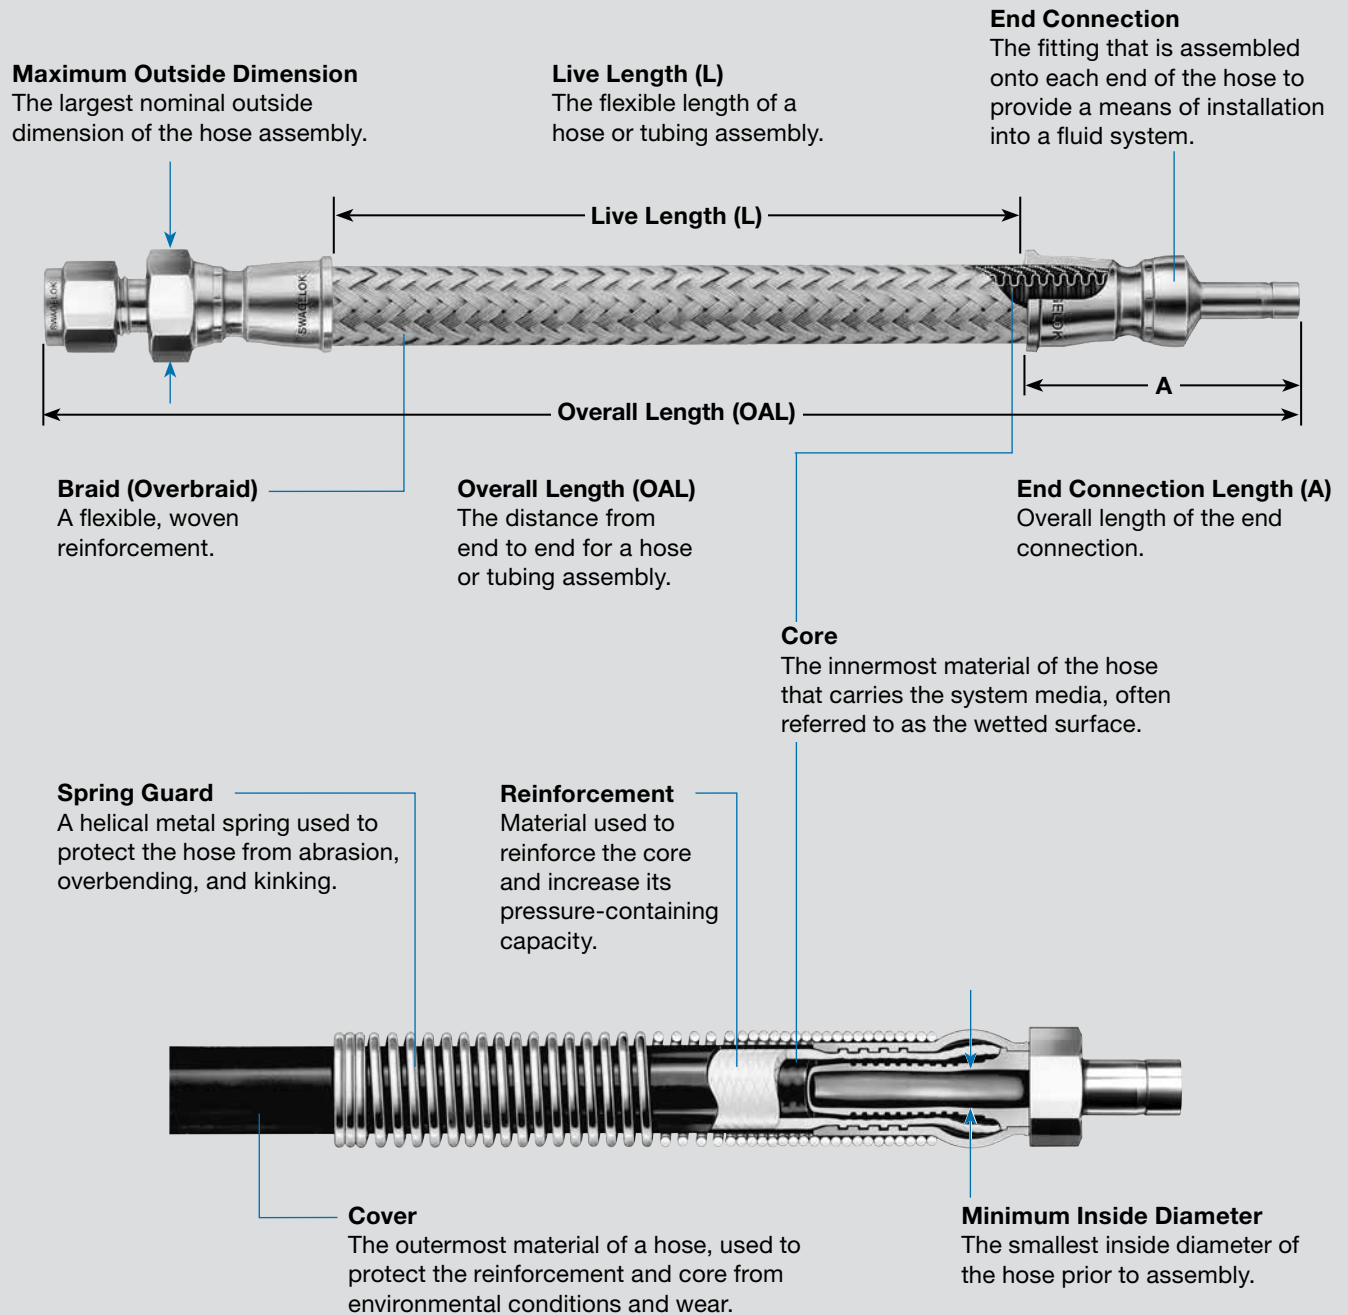

### Static Application

An application in which the hose is stationary and does not move in any plane.

## Considerations for Selecting a Hose Assembly Solution

### Temperature

Identify the minimum and maximum temperatures the hose assembly will be exposed to with regard to the system media and the environment.

### Pressure

Identify the minimum and maximum pressures (or vacuum) within and outside the hose assembly.

### Material

Identify the system media and the environment to which the hose assembly will be exposed. This will help determine the materials of construction best suited to the application demands and whether the hose requires a static dissipative core.

### Movement

Confirm whether the hose assembly will be installed in dynamic applications as this will require different considerations than a static application.

### Length

Determine the most likely route for installation of the hose, and use this to identify length requirements.

### Cleanliness

Identify the need for cleanliness. Ease of cleaning the internal surfaces of the hose, as well as maintaining outside cleanliness may be of concern.

### End Connection

Identify the type of end connections which are most compatible with the system requirements. End connections differ with regard to materials of construction and pressure ratings.

### Orientation

Clarify space constraint concerns. Hose assemblies with elbows and union ball joints may help resolve space constraint issues.

### Desired Flow

Consider desired flow. Hose connection size, core tube construction, and routed installation may impact flow.

### Drainability

Consider core construction as this will impact drainability.

### Test Reports

Identify the need for documentation in the form of test reports.

### Special Testing

Many applications may require testing to requirements different from the production tests listed. For example, metal hose assemblies undergo an inboard helium leak test to a maximum leak rate of  $1 \times 10^{-5}$  std cm<sup>3</sup>/s. If your application uses liquid at a positive pressure, you may request an additional hydrostatic proof test.

### Special Marking

Discuss special marking requirements; there are different options available to readily identify hose assemblies.

### Documentation and Regulatory Requirements

Identify the need for special regulatory approvals or documentation.

### Additional Protection and Covers

Identify whether covers are necessary for additional protection of the hose assemblies or surrounding systems.

### Additional Considerations

- Use of hose and tubing within applications and handling practices will affect how it performs over time. Catalog performance claims such as burst pressure, working pressure, static dissipation, moisture content, permeation rates, and cycle life apply to never-used products. For this reason, system maintenance and replacement schedules should be considered.

### Cautions

- ⚠ **Nylon, PFA, polyethylene, PTFE, and rubber are permeable materials. Gases, vapors, and liquids may migrate through cores of these materials. The rate of permeation is affected by many application-specific variables.**
- ⚠ **Nonperforated covers may blister in gas service.**
- ⚠ **Thermal cycling of any nonmetal hose may affect its ability to maintain a positive seal. Testing should be performed to verify suitability in actual operating conditions.**
- ⚠ **All equipment must be properly grounded to allow static dissipation and help to prevent static sparking.**
- ⚠ **Nonconductive hoses can be conduits for electricity if they contain conductive fluids. Verify the conductive properties of the system media prior to use.**

## Swagelok Hose and Flexible Tubing Installation and Use Guide

### Inspection

Establish an inspection schedule based on system application and replacement history.

### Electrostatic Discharge

Static electricity can be generated by fluid passing through the hose. Select hose with sufficient conductivity to ground the static electric charge and allow static dissipation. If static electricity generation is possible within an application, choose static dissipative hose and properly ground to earth.

### Vibration

Evaluate amount of system vibration when selecting hose. Metal hose may not be appropriate for systems with constant or severe vibration.

### Length

Take into consideration hose movement, system pressurization, and thermal expansion when determining hose length. Installing hose that does not have sufficient length to accommodate these factors may reduce hose life.

### Minimum Bend Radius

Follow minimum bend radius requirements for your hose. Installing hose with smaller bends may kink hose and reduce hose life.

Hose rupture or leakage may result from bending too close to the hose/fitting connection.

### Hose Strain

Elbows and adapters can be used to relieve hose strain.

### Motion Absorption

For additional information, see SAE J1273, *Recommended Practices for Hydraulic Hose Assemblies*.

Distribute movement and prevent bends smaller than the hose's minimum bend radius by providing sufficient hose length.

### Machine Tolerance

Allow for changes in length resulting from machine motion and tolerances.

### System Pressure Changes

Allow sufficient hose length to accommodate changing system pressures. Do not connect high- and low pressure hoses.

### Bending in One Plane

Avoid twisting the hose by bending it in one plane only. For a compound bend, use multiple hose pieces or other isolation methods.

## FM Series Metal Hose

### Testing

Every Swagelok FM series hose assembly is inboard helium leak tested to a maximum leak rate of  $1 \times 10^{-5}$  std cm<sup>3</sup>/s.

For additional testing, see **Testing**, page 338.

### Cleaning and Packaging

Swagelok FM series hose components are cleaned in accordance with Swagelok *Standard Cleaning and Packaging (SC-10)* (MS-06-62), page 1174. Each hose is bagged individually and boxed; longer hoses are coiled, bagged, and boxed.

**Do not subject flexible metal hose to pressure surges, shock, or pulsations, where the peak pressure is greater than 50 % of the working pressure rating.**

- PTFE material complies with FDA regulation 21CFR Part 177.1550 and 3-A for contact with water, food, and beverage.
- Optional carbon black-filled PTFE core is available for applications that require static dissipation (Ω).
- Select static dissipative hose assemblies are approved to ECE R110; see page 340 for more information.
- Commonly used where chemical compatibility and permeation resistance is desired.
- Standard and custom assemblies available.
- Options include hose covers and hose tags. See page 338 for details.

Swagelok vinyl tubing is cleaned in accordance with Swagelok *Standard Cleaning and Packaging (SC-10)* (MS-06-62), page 1174. Each roll of tubing is coiled individually and boxed.

## HC Series—End Connections for Soft Tubing and Hose

### Features

- HC series end connections allow for easy installation of soft plastic or rubber tubing.
- 316 stainless steel or brass material.
- Size range of 1/8 to 1 in.
- Reusable for other assemblies.
- May be used without a hose clamp or sleeve in low-pressure applications.
- Use of a hose clamp or sleeve may be required in higher-pressure applications.

### Ordering Information

Add **SS** for 316 stainless steel or **B** for brass to the basic ordering number.

Example: **SS-2-HC-1-2**

For end connection barb dimensions, see page 320. To determine the cut length of bulk hose for field assembly, subtract dimension *B* for each end connection from the desired overall length.

### Testing

Every Swagelok NG series hose assembly is pressure tested with water at room temperature for 30 seconds to a requirement of no detectable leakage. Testing is performed at 5000 psig (344 bar). Every Swagelok NG series hose assembly is factory tested for electrical conductivity.

### Cleaning and Packaging

Swagelok conductive core hose components are cleaned in accordance with Swagelok *Standard Cleaning and Packaging (SC-10)* (MS-06-62), page 1174. Each hose is bagged individually and boxed; longer hoses are coiled, bagged, and boxed.

#### Warning:

**All equipment must be properly grounded to allow static dissipation and help to prevent static sparking.**

**Periodic inspection of hose assembly is recommended. End-to-end electrical resistance of the hose assembly must not exceed 1 M $\Omega$  per meter when tested at 500 VDC.**
