e.g. Sculptor

Virgo $m-M=31 . \quad(17 M p c)$ NGC3379 m-M=30. (10Mpc) $\mathrm{M} 81 / \mathrm{Scl} m-\mathrm{M}=27.7$ (3.5Mpc) M31 m-M=25. (1Mpc)

Virgo:

TRGB, $\mathrm{K}=26.5$; $\mathrm{I}=28.75$
HB, K=I=31
5Gyr old MSTO, K=33; I=33.8

$[\mathrm{Fe} / \mathrm{H}]=-0.7 ; 1,2,3,5,10,13 \mathrm{Gyr}$

Yi et al. (2003, ApJS, 144,

10 " at 17 Mpc ( $\mathrm{m}-\mathrm{M}=31.2$ ), is 820 pc (equiv. to $4^{\prime}$ fov in LG)

Need at least 100 stars per region of the CMD that needs to be modeled, e.g., to get 100 RGB stars need to look at a surface brightness of $\sim 27 \square \square$ with a 10 " fov at virgo.

## Trade-Offs

Field of View (fraction of galaxy; size of detector)
Pixel Size (resolution; diffraction limit; surface brightness limit)

Sensitivity (MSTO, HB, TRGB, E-AGB, young massive stars)

Table 1. Potential targets for an ELT

| Object | $(\mathrm{m}-\mathrm{M})_{0}$ | $\theta(1 \mathrm{pc})$ | $\mathrm{Ra}(\mathrm{J} 2000)$ | Dec |
| :--- | :---: | :---: | :---: | :---: |
| LMC | 18.5 | $4^{\prime \prime}$ | 0523 | -6945 |
| M31 | 24.3 | $0.3^{\prime \prime}$ | 0043 | +4116 |
| Sculptor Group | 26.5 | $0.1^{\prime \prime}$ | 0023 | -3800 |
| M81/82 | 27.8 | $0.06^{\prime \prime}$ | 0955 | +6940 |
| Cen A | 28.5 | $0.04^{\prime \prime}$ | 1325 | -4300 |
| Leo Group | 30.0 | $0.02^{\prime \prime}$ | 1048 | 1235 |
| Virgo Cluster | 31.2 | 12 mas | 1226 | +1243 |
| Fornax cluster | 32.0 | 11 mas | 0337 | -3537 |
| 50 Mpc | 33.5 | 4 mas | $\ldots$ | $\ldots$ |
| Arp220 | 34.5 | 2 mas | 1534 | +2330 |
| Perseus Cluster | 34.5 | 2 mas | 0318 | +4131 |
| Stephan's Quintet | 35.0 | 2 mas | 2236 | +3357 |
| Coma Cluster | 35.0 | 2 mas | 1300 | +2800 |
| Redshift z $\sim 0.1$ | 38.5 | 0.5 mas |  | $\ldots$ |
| Redshift z $\sim 0.3$ | 41 | 0.2 mas |  | $\ldots$ |

| Requirements | imaging | spectroscopy |
| :---: | :---: | :---: |
| Field of view | stars at $3 \mathrm{Mpc}: 10^{\prime}$ <br> stars at $10 \mathrm{Mpc}: 3^{\prime}-10^{\prime}$ <br> stars at 18 Mpc : $10^{\circ}-1^{\prime}$ | $10^{-}-5^{\prime}$ |
| -diameter of 50\% enclosed energy circle <br> -strehl ratio (or "diff. lim." for diffraction limited) | diffraction limited | diffraction limited |
| photometric uniformity in field and/or time | field: 0.02 mag time: repeatability important |  |
| photometric accuracy | 0.05 mag (goal: 0.02) |  |
| spectral resolution |  | 5000-40000 |
| wavelength ( $\mu \mathrm{m}$ ) | $0.6-3 \mu \mathrm{~m}$ | $0.4-1.5 \mu \mathrm{~m}$ |
| multiplex | N/A | $\begin{aligned} & 100+\text { @LR }(\sim 5000) \\ & 50+@ \operatorname{RR}(\sim 20000) \\ & 5+@ \text { HR }(-40000) \\ & \hline \end{aligned}$ |
| typical magnitude | see table below | see table below |
| object size | $1^{\prime \prime}-5^{\prime \prime}\left(10^{\prime \prime}-5^{\prime}\right)$ |  |
| typical exposure time | 8-10 hours | 8 -10 hours |
| target density | stars at $3 \mathrm{Mpc}: 10^{3}$ stars $^{2} \mathrm{arcsec}^{2}$ stars at $10 \mathrm{Mpc}:>10^{3}$ stars $/$ arcsec $^{2}$ stars at $18 \mathrm{Mpc}:>10^{3}$ stars $^{2} /$ arcsec $^{2}$ |  |
| dynamic range | maximum $\sim 10^{4}$ |  |
| background/emissivity | as dark and stable as possible | as dark and stable as possible |
| astrometric/plate scale stability | critical for spectroscopic targets | critical |
| polarisation | no importance | no importance |
| sky coverage |  | north and south ok |
| Date/Time constraint | no importance | no importance |
| can be done with 30 m can be done with 42 m can be done with 60 m | For both imaging and spectroscopy the larger the aperture the more can be done at greater distances |  |
| can be done with JWST |  |  |
| obs type | imaging | mulit-object or single-object spectroscopy |
| comments - add additional requirements | Preferred ELT aperture: 50 m (or more) <br> pixel scale: $1-5 \mathrm{mas}$ <br> Adaptive Optics: LTAO <br> S/N central pixel: >10 <br> Virgo Cluster of galaxies preferably less <br> than $30^{\circ}$ from Zenith in the meridian | Preferred ELT aperture: 50 m (or more) pixel scale: 1-5mas <br> Adaptive Optics: LTAO <br> S/N central pixel: $>10 @$ LR --->>40@IR and HR <br> Virgo Cluster of galaxies preferably less than $30^{\circ}$ from Zenith in the meridian |

a "typical" elliptical galaxy, which stopped forming stars 5Gyr ago.
Thus a representative stellar population to begin the modelling. It is just a list of stars with no fancy assumptions - no incompleteness - no noise etc. this should ideally come from the conversion into an image. It is assuming a V band surface brightness= $24 \mathrm{mag} / \mathrm{arcsec}^{2}$
