Abstract.

Information Technology has dramatically impacted the librarian and their relationship to the communities they serve. This paper discusses some of the changes that have already taken place and suggests changes that one may observe in the future.

1. Introduction

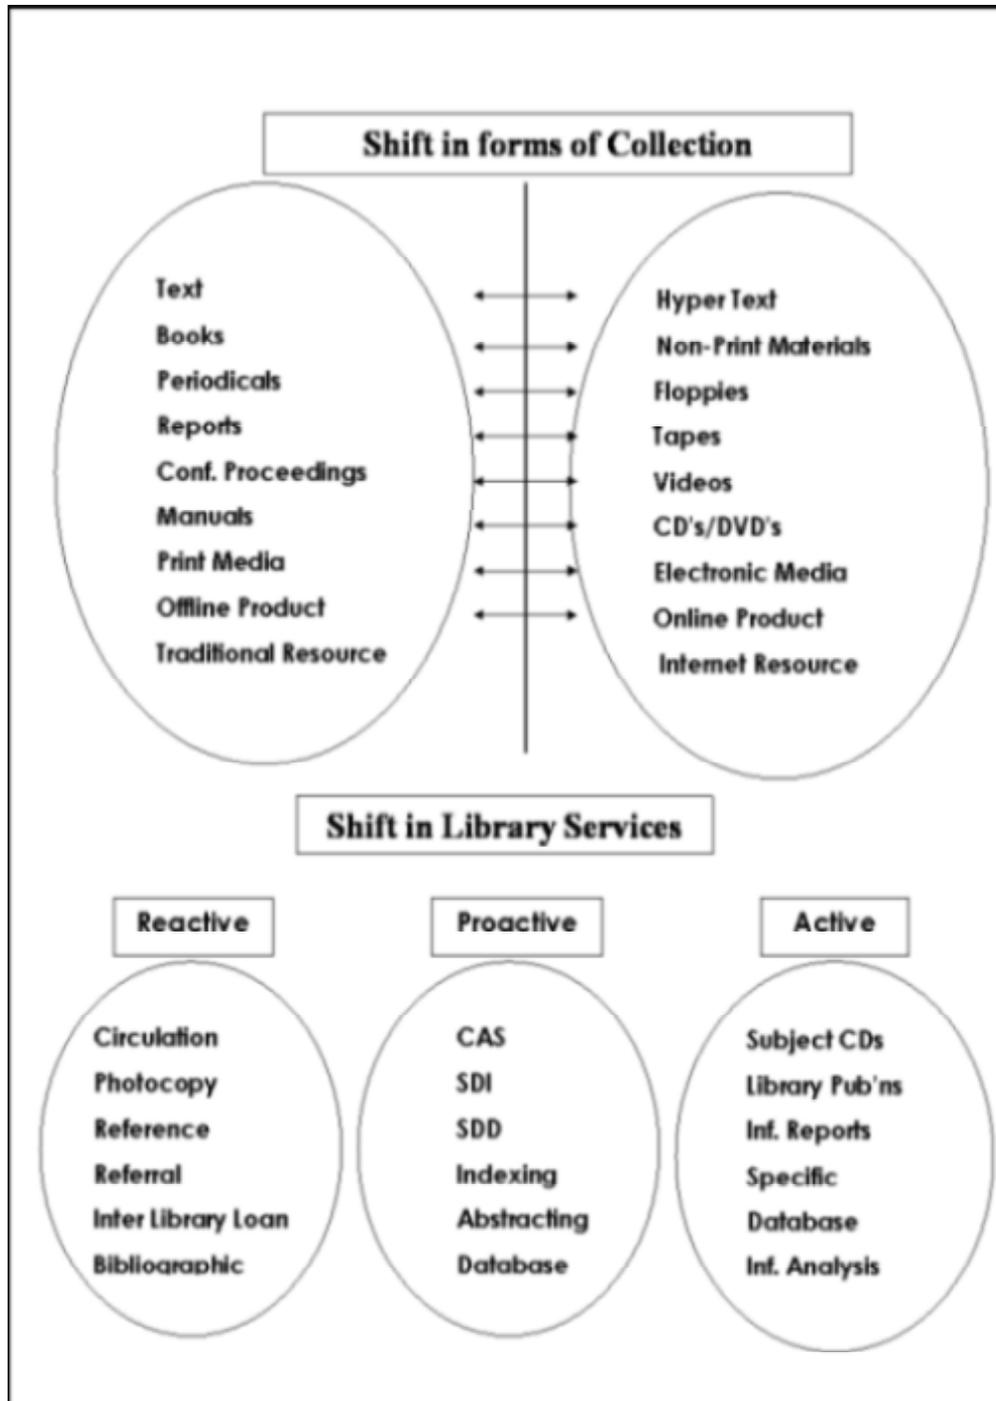

As we are at the threshold of year 2002, we librarians must reassess and reconsider the changing library environment. Librarians, individually and collectively, cannot ignore the changing shape of information services that are emerging. Everyone knows that the primary objective of libraries is to organize and provide access of information. This objective will never change, but the format and methods that we have used will change dramatically; thus, providing new opportunities and challenges.

2. Goals

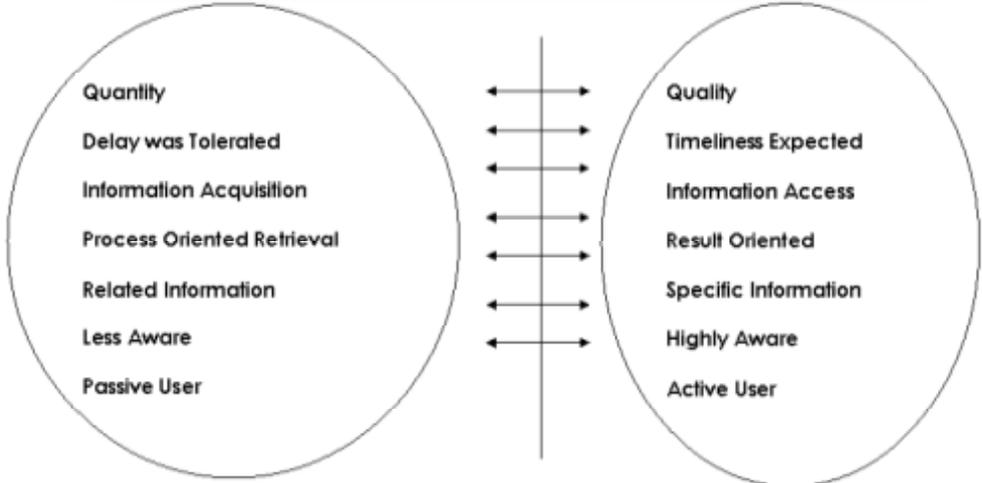

This paper attempts to review the role of library professionals in their present environment and suggests key skills that will need to be considered if professional progress is to occur. The focus of the paper is on rethinking the role of a library professional, both in relationship to his personal identity and the community he serves.

3. Solutions

The paper describes the changes taking place in the library as they relate to the collection, library services, information management, and the overall shift in attitude and approach to the library profession. It also enumerates the role of the librarians in the 'IT' era, such as that of manager, resource procurer, creator or disseminator, preserver of culture, knowledge organizer, researcher or retriever, educator, lifelong learner, expert or advisor and advocate. etc. The paper also addresses the competencies required to perform these roles.

Shift in Information Seeking Features Of Users

Shift in the professional's approach to work
